Groundwater data for 336 wells during 2006-2008 used for training ANN has been obtained from <http://www.water.ca.gov/waterdatalibrary/>

Long term Groundwater observations available at this well location

STUDY AREA

# APPROACH AND RESULTS

---

**Prepare the inputs:** Grid the input data to the same Target Resolution, 4km.

Compute Average of Precipitation of  $n$ ,  $(n-1)$  and  $(n-2)$  months for Precipitation value of  $n^{th}$  month

---

Set up the Artificial Neural Network (ANN) Architecture in MATLAB Deep Learning Toolbox

---

Train the ANN model and see which parameters are essential.

Retrain the ANN with essential Parameters.

---

Check for internal consistency by comparing the storage changes from wells and the model

---

Simulate the ANN model for points for all the points in Central Valley at Target 4 km resolution

# APPROACH AND RESULTS

---

**Prepare the inputs:** Grid the input data to the same Target Resolution, 4km.

Compute Average of Precipitation of  $n$ ,  $(n-1)$  and  $(n-2)$  months for Precipitation value of  $n^{th}$  month

---

**Set up the Artificial Neural Network (ANN) Architecture in MATLAB Deep Learning Toolbox**

---

Train the ANN model and see which parameters are essential.

Retrain the ANN with essential Parameters.

---

Check for internal consistency by comparing the storage changes from wells and the model

---

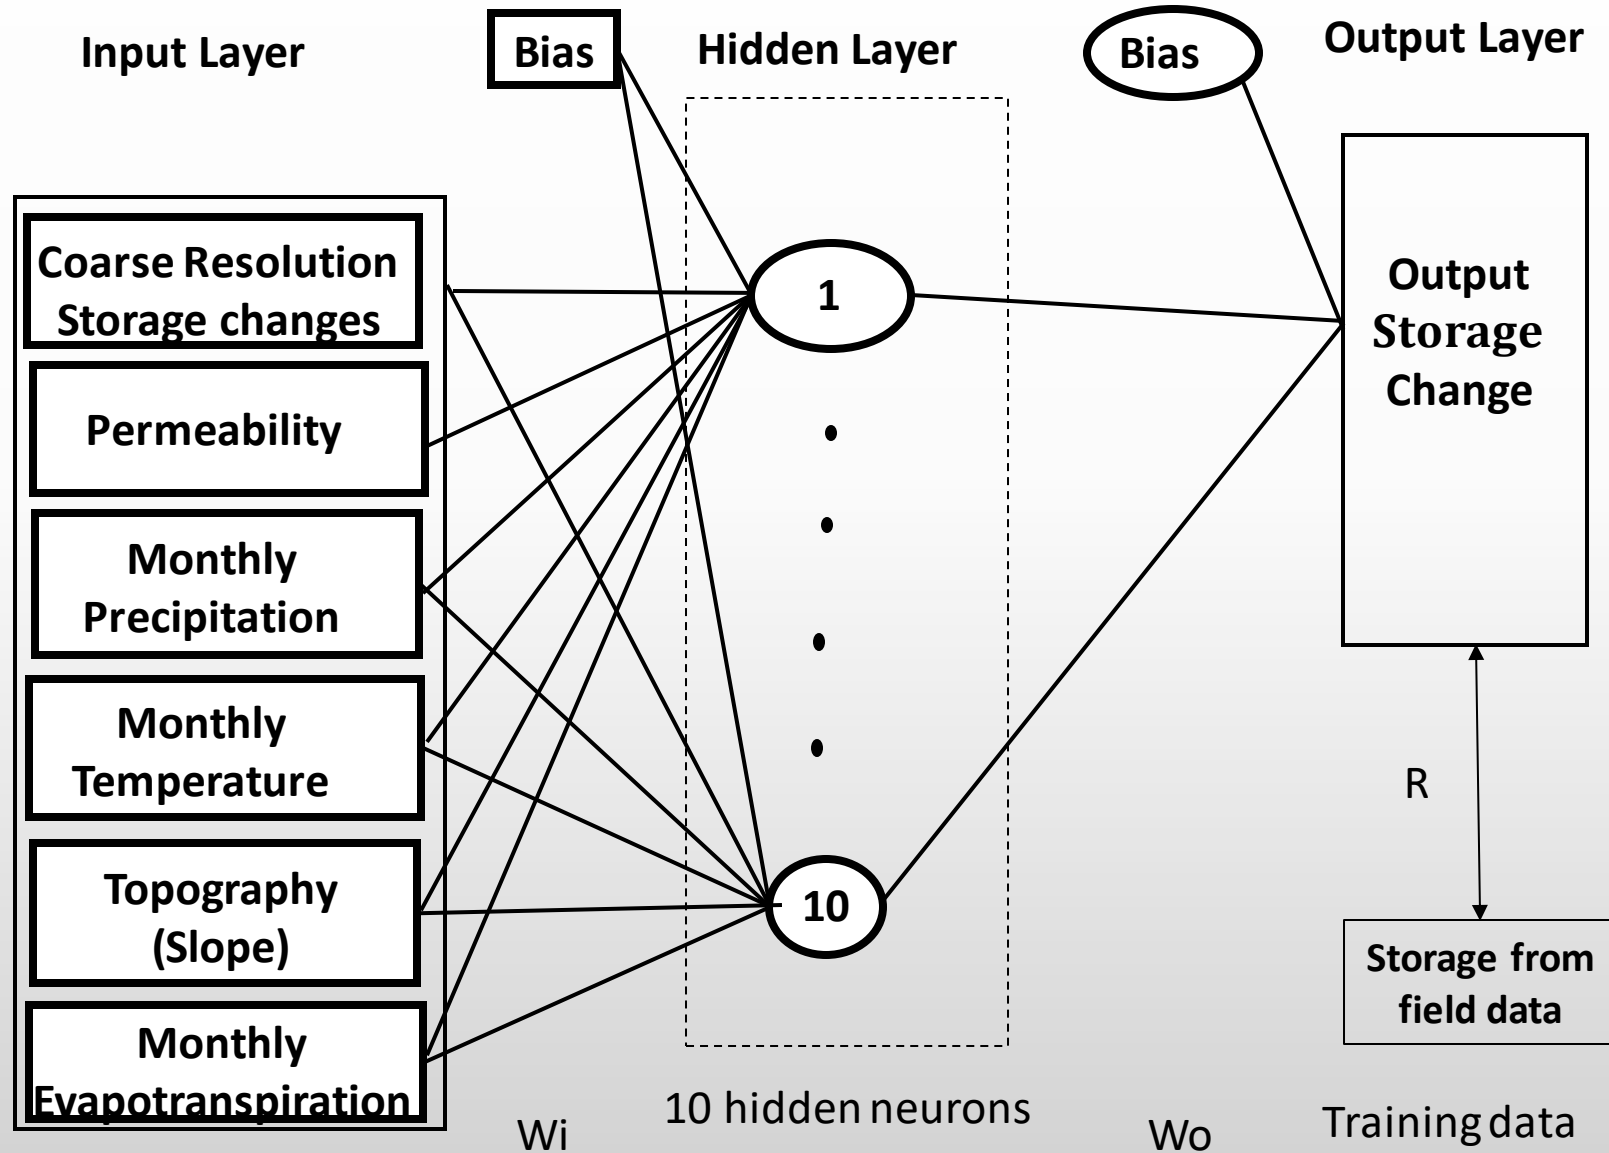

Simulate the ANN model for points for all the points in Central Valley at Target 4 km resolution

# DOWNSCALING TECHNIQUES

- **Dynamic downscaling**
  - regional numerical model at higher spatial resolution
  - applied in local areas at smaller scale
- **Statistical downscaling**
  - empirical relationships between large-scale variables (predictors) and local-scale variables of interest (predictands).

E

**Feedforward  
Propagation  
network**

Propagation of the error in the backward direction to adjust the network weights and biases

**Back-**

**Bayesian Regularization  
Training algorithm**

Good generalization for difficult datasets. Training stops according to adaptive weight minimization

# APPROACH AND RESULTS

---

**Prepare the inputs:** Grid the input data to the same Target Resolution, 4km.

Compute Average of Precipitation of  $n$ ,  $(n-1)$  and  $(n-2)$  months for Precipitation value of  $n^{th}$  month

---

Set up the Artificial Neural Network (ANN) Architecture in MATLAB Deep Learning Toolbox

---

Train the ANN model and see which parameters are essential.

Retrain the ANN with essential Parameters.

---

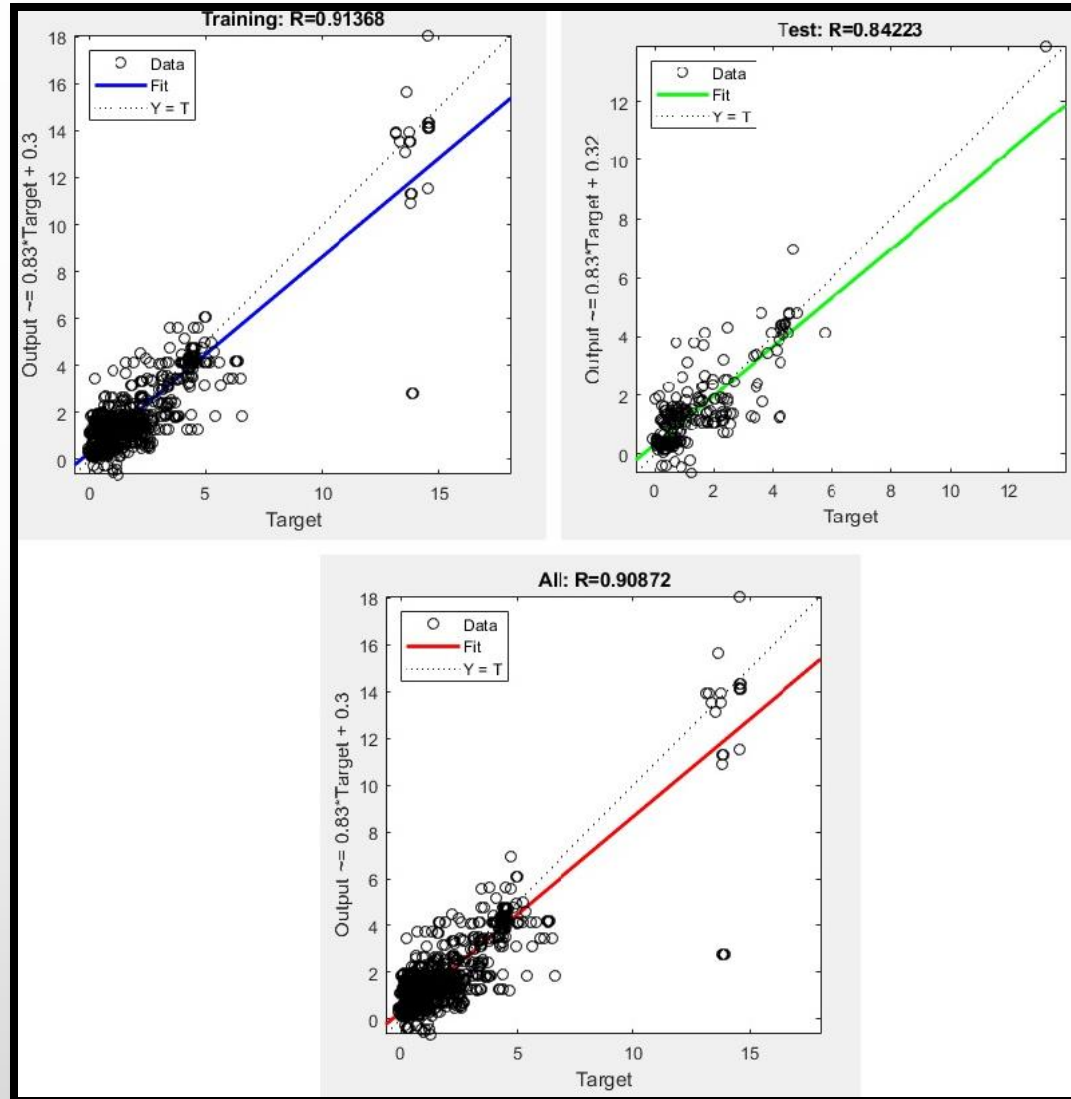

Check for internal consistency by comparing the storage changes from wells and the model

---

Simulate the ANN model for points for all the points in Central Valley at Target 4 km resolution

# WORKING OF THE ANN

Regression Coefficient – 90 % correlation between ANN Output and Target well data

**Nash–Sutcliffe efficiency (NSE)** Predictive power of ANN model

$$NSE = 1 - \frac{\sum_{t=1}^T (Q_m^t - Q_o^t)^2}{\sum_{t=1}^T (Q_o^t - \overline{Q_o})^2}$$

$Q_m$  and  $Q_o$  represent simulated and observed data respectively, whereas  $\overline{Q_o}$  represent mean of observed data

Value obtained: 0.83  
(Excellent predictions)

## Order of importance of variables:

Based on Connection weight approach as suggested by Olden et al., 2004.

Following are the variables in order of importance:

1. GRACE
2. Permeability
3. Monthly Precipitation

Other variables (Monthly Temperature, Slope, Monthly evapotranspiration) were discarded for ANN training.
